

## **ABSTRACT**

In an exemplary described implementation, an electronic device is configured to perform operations that include: activate a platform dependent module that is targeted to run on a current platform of the electronic device; activate an error detection module for the current platform using the platform dependent module; retrieve an error detection scheme; apply the retrieved error detection scheme to received data to determine error detection data; compare the determined error detection data to received error detection data; and if the determined error detection data matches the received error detection data, provide at least one feature with respect to the received data. Other apparatus, method, arrangement, system, media, etc. implementations are described herein.
